Molecular characterization, chromosomal localization, and modeling of the active site.";

J. Immunol. 148:2817-2825(1992).

-1- FUNCTION: THERMOLYSIN-LIKE SPECIFICITY, BUT IS ALMOST CONFINED ON ACTING ON POLYPEPTIDES OF UP TO 30 AMINO ACIDS. BIOLOGICALLY IMPORTANT IN THE DESTRUCTION OF OPIOID PEPTIDES SUCH AS METAND LEU-ENKEPHALINS BY CLEAVAGE OF A GLY-PHE BOND.

-1- CATALYTIC ACTIVITY: Preferential cleavage at the amino group of hydrophobic residues in insulin, casein, hemoglobin, and a number
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               NEP_MOUSE STANDARD; PRT; 749 AA. -1- ALTERNATIVE PRODUCTS: 4 ISOFORMS; A, B (SHOWN HERE), C AND D; ARE PRODUCED BY ALTERNATIVE SPLICING.
-1- TISSUE SPECIFICITY: ALL ISOFORMS ARE EXPRESSED IN UMBLICAL VEIN CARDIOMYCCYTES AND VENTRICLES. ISOFORMS A, B AND C ARE ALSO EXPRESSED IN PLACENTA, LUNG, HEART, ADRENAL GLAND AND PHAROCHROMOCYTOMA; ISOFORMS A, AD C IN LIVER, TESTIS AND SMALL INTESTINE; ISOFORMS B, C AND D IN ENDOTHELIAL CELTS AND UMBLICAL INTESTINE; ISOFORM B, C AND D IN ENDOTHELIAL CELTS AND UMBLICAL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            or send an email to license@isb-sib.ch).

ALTERNATIVE PRODUCTS: 4 ISOFORMS; A (SHOWN HERE), B, C AND D; ARE PRODUCED BY ALTERNATIVE SPLICING.

TISSUE SPECIFICITY: ALL ISOFORMS ARE EXPRESSED IN AORTIC ENDOTHELIAL CELLS. ISOFORM A IS ALSO EXPRESSED IN LIVER; ISOFORM E IN SMOOTH MUSCLE CELLS, AND FIBROBLASTS; ISOFORM C IN AORTIC IN SMOOTH MUSCLE CELLS, FIBROBLASTS, LIVER AND LUNG, AND ISOFORM D IN SMOOTH MUSCLE CELLS.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY M13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             FUNCTION: CONVERTS BIG ENDOTHELIN-1 TO ENDOTHELIN-1.
CATALYTIC ACTIVITY: Forms endothelin 1 by cleavage of the 21-
TIP-1-Val-22 bond in the precursor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ENZYME REGULATION: INHIBITED BY PHOSPHORAMIDON (BY SIMILARITY). CATALYTIC ACTIVITY: Forms endothelin 1 by cleavage of the
Trp-1-Val-22 bond in the precursor.
ENZYME REGULATION: INHIBITED BY PHOSPHORAMIDON.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SUBUNIT: HOMODIMER.

                                                                                                        5.5. INACTIVE AT NEUTRAL PH.

-!- CATALYTIC ACTIVITY: Forms endothelin 1 by cleavage of the 21-
Trp-|-Val-22 bond in the precursor.
-!- ENZYME REGULATION: INHIBITED BY PHOSPHORAMIDON.
                                                                                                                                                                                sensitive metalloprotease with acidic pH optimum."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           metallopeptidase expressed in response to neuronal damage and activates superoxide scavengers."

Proc. Natl. Acad. Sci. U.S.A. 97.4345-4350(2000).

1- FUNCTION: May contribute to the degradation of peptide hormones involved in the inactivation of neuronal peptides.

1- COPACTOR: Binds 1 zinc ion (By similarity).

1- SUBCELLULAR LOCATION: Type II membrane protein (By similarity).

1- SUBCELLULAR LOCATION: Type II membrane protein (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          755 RVLGTLSNSRDFLRHFGCPVGSPMNSG-QLCEVW 787

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Protect against C2-ceramide-induced apoptosis.

COFACTOR: Binds 1 zinc ion (By similarity).

SUBCELLULAR LOCATION: Type II membrane protein.

TISSUE SPECIFICITY: Highly expressed in the CNS, in particular in nucleus of the thalamus part of the hypothalamus, in cranial spinal tract trigeminal nucleus. Not detected in cerebral cortex, remaining and cerebellum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        INDUCTION: By mechanical damage to nerve cells. SIMILARITY: BELONGS TO PEPTIDASE FAMILY M13.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 FUNCTION: May contribute to the degradation of peptide hormones and be involved in the inactivation of neuronal peptides. Cleave the synthetic substrate 2-Gly-Gly-Leu-pNA and releases pNA, May

A strong signal was also detected in uterine subepithelial cells and around renal blood vessels. Detected at lower levels in amygdala, caudate, thalamus, pancreas and skeletal muscle. Detected at very low levels in substantia nigra, cerebellum, cortex, corpus callosum and hippocampus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        FUNCTION: May contribute to the degradation of peptide hormones
